WEB FIG. 2 Risk of bias summary: review authors' judgements about each risk of bias item for each included study.

WEB APPENDIX 1 ASSUMPTIONS AND CALCULATIONS FOR IMPUTATION/INTERPRETATION OF DATA FROM STUDIES INCLUDED IN THE SYSTEMATIC REVIEWSlayton 2016

1. The total number of participants is not provided in the published paper. The number is assumed from the total number of households and the median number of two children per household.
2. The number of episodes of infection are the reported episodes of illness in the 'past' 48 hours during biweekly visits to the households.
3. The denominator of person weeks calculated by dividing the number of biweekly visits by half.

Shafique 2016

1. The data from 'Hand Sanitiser Only' and 'Hand Sanitiser and Micronutrient' groups combined as intervention and Control, and 'Micronutrient Only' groups combined as control.
2. The episodes of cough were diagnosed if the child reported to have any sort of cough or difficulty breathing. An upper respiratory tract infection was diagnosed if the mother reported symptoms of a stuffy or runny nose in her child. Both the episodes are presented separately, and combined under the section 'ARI'.

Pickering 2015

1. The infection episodes are mean proportions expressed by respondents in a 2-week recall period.
2. Respiratory infections were described under three headings: congestion, cough and difficulty breathing. Here cough is included assuming it would be a common symptom for upper and lower respiratory infections.

Patil 2014

The confidence intervals for the change in means is given. The SD is calculated with the assumption that they are the same for both the groups as calculated for Clasen 2014.

Clasen 2014

1. The individual SDs for weight-for-age and length-for-age Z-scores for the control and intervention groups was not available from the intervention data. However, the effect size (difference in mean) and its 95% CI was available. The SD for the two groups was calculated from 95% CI or SE as per standard statistical recommendations.
2. For Soil Transmitted Helmentiasis, the mean prevalence of the entire population is given. The prevalence was assumed to be the same for children and numbers calculated from there.

Pickering 2013

The number of school absence was calculated from the percentages given. Only one week data was given and this is represented as such in the calculations.

Freeman 2013a

1. A total of 1113 students were assessed at follow up. The split numbers of intervention and control groups were not provided. However, the median populations at the time of second follow up were given as 302 for intervention and 275 for control group. The total population was split in the same proportion.

For intervention, $n = (302/577) * 1113 = 583$

For control, $n = 530$

2. Only the percentage prevalence of helminth infection was mentioned. The individual numbers were calculated from percentages.
3. The same procedure was followed for school absence
4. SE converted to SD. Pupil reported absence used for quantitative analyses

Peletz 2012

For weight-for-age Z scores, the mean scores at the end and P value were mentioned.

Mean intervention = -1.21; Mean control = -1.24; $P = 0.92$

n for intervention = 61; n for control = 60

From p to t: Degree of freedom $61 + 60 - 2 = 119$

$t = 2.358$ (from table)

$SE = MD/t = -1.21 + 1.24 / 2.358 = 0.03 / 2.358 = 0.0127$

$SD = 0.0127 / 0.178 = 0.071$

Bowen 2012

SD derived from 95% CI using $SD = \sqrt{(UL - LL)}$

Rosen 2006

1. Absenteeism was analyzed in terms of the percentage of days the child was absent; number of days calculated from percentage and n .
2. There were a total of 66 days of study period. Person-weeks of exposure calculated from n and this figure.

Crump 2005

This study provided the number of deaths in children less than 5 years of age but not the total number of children. Based on the inclusion criteria, the total number of children less than 2 years is provided. We have this number as the denominator while analyzing the mortality data assuming that the proportion of children between 2-5 years would be the same in the intervention and control groups.

Emerson 2004

The number of children less than 9 years and number with trachoma calculated from percentage figures.

WEB APPENDIX 3 SUMMARY OF FINDINGS TABLES

A. Hygiene Compared to No Intervention for Children

Patient or population: Children; Settings: Low- and Middle-income Countries

Intervention: Hygiene ; Comparison: No intervention

Outcomes	Illustrative comparative risks* (95% CI)		Relative effect (95% CI)	No of Participants (studies)	Quality of the evidence (GRADE)	Comments
	Assumed risk	Corresponding risk				
	No intervention	Hygiene				
Weight (kg)		The mean weight in the intervention groups was 0.2 higher (0.12 lower to 0.52 higher)		1272 (1 study)	⊕⊕⊕⊕ very low ^{1,2}	
Weight (Follow-up) (kg)		The mean weight (follow up) in the intervention groups was 0.2 lower (0.53 lower to 0.13 higher)		1390 (1 study)	⊕⊕⊕⊕ very low ^{1,2}	
Height (mm)		The mean height in the intervention groups was 10 higher (5.39 lower to 25.39 higher)		1272 (1 study)	⊕⊕⊕⊕ very low ^{1,2,3}	
Height (Follow-up) (mm)		The mean height (follow up) (mm) in the intervention groups was 10 lower (24.77 lower to 4.77 higher)		1390 (1 study)	⊕⊕⊕⊕ very low ^{1,2}	
Weight for age		The mean weight for age in the intervention groups was 0 higher (1.26 lower to 1.26 higher)		1272 (1 study)	⊕⊕⊕⊕ very low ^{1,2}	
WAZ (Follow-up)		The mean WAZ (follow-up) in the intervention groups was 0 standard deviations higher (0.09 lower to 0.1 higher)		1691 (2 studies)	⊕⊕⊕⊕ low ^{4,5}	SMD 0 (-0.09 to 0.1)
Height for age		The mean height for age in the intervention groups was 0 higher (0.66 lower to 0.66 higher)		1272 (1 study)	⊕⊕⊕⊕ very low ^{1,2}	
HAZ (Follow-up)		The mean HAZ (follow-up) in the intervention groups was 0 standard deviations higher (0.1 lower to 0.09 higher)		1691 (2 studies)	⊕⊕⊕⊕ low ^{4,5}	SMD 0 (-0.1 to 0.09)
Weight for Height		The mean weight for height in the intervention groups was 0 higher (0.99 lower to 0.99 higher)		1272 (1 study)	⊕⊕⊕⊕ very low ^{1,2}	
WFH (Follow up)		The mean WFH (follow up) in the intervention groups was 1 lower (1.95 to 0.05 lower)		1390 (1 study)	⊕⊕⊕⊕ very low ^{1,2}	
BMI Z score (Follow up)		The mean BMI Z score (follow up) in the intervention groups was 0.1 higher (0.2 lower to 0.4 higher)		301 (1 study)	⊕⊕⊕⊕ very low ^{2,6}	
Low WAZ	Study population		RR 0.85 (0.46 to 1.58)	168 (1 study)	⊕⊕⊕⊕ very low ^{7,8}

	14 per 1000	9 per 1000 (3 to 24)

*The basis for the assumed risk (e.g. the median control group risk across studies) is provided in footnotes. The corresponding risk (and its 95% confidence interval) is based on the assumed risk in the comparison group and the relative effect of the intervention (and its 95% CI).

CI: Confidence interval; RR: Risk ratio;

GRADE Working Group grades of evidence

High quality: Further research is very unlikely to change our confidence in the estimate of effect.

Moderate quality: Further research is likely to have an important impact on our confidence in the estimate of effect and may change the estimate.

Low quality: Further research is very likely to have an important impact on our confidence in the estimate of effect and is likely to change the estimate.

Very low quality: We are very uncertain about the estimate.

¹ Downgraded by 1 for serious risk of bias. The included trial had high risk of bias for unit of analysis error, allocation concealment and blinding.

² Downgraded by 2 for Indirectness as there is only one included study from Asia. Extrapolation to other areas and populations not possible.

³ Downgraded by 1 for imprecision. There is only included study, with few study participants and estimates have wide confidence intervals around the estimate of the effect

⁴ Downgraded by 1 for serious risk of bias. Both trials had high risk of bias for allocation concealment and blinding and one had high risk of bias for unit of analysis error

⁵ Downgraded by 1 for indirectness as both included trials are from South Asia. Extrapolation to other areas and population not possible.

⁶ Downgraded by 1 for serious risk of bias. The one included trial had high risk of bias for blinding and allocation concealment

⁷ Downgraded by 1 for serious risk of bias. The included trial had high risk of bias for recruitment, allocation concealment and blinding.

⁸ No explanation was provided

⁹ Downgraded by 1 for serious risk of bias. All trials were at high risk of bias for blinding. Two trial were considered at high risk of bias for attrition.

¹⁰ Downgraded by 1 for imprecision. There are only two studies, with estimates that have wide confidence intervals around the estimate of the effect

¹¹ Downgraded by 1 for serious risk of bias. The two included trials had high risk of bias for allocation concealment and blinding.

¹² Downgraded by 1 for serious risk of bias. One trial had high risk of bias for allocation concealment and both for blinding

¹³ Downgraded by 1 for serious risk of bias. All four trials had high risk of bias for allocation concealment and blinding. One trial had risk of bias for attrition.

¹⁴ The one included trial had high risk of bias for blinding, allocation concealment and baseline balance between clusters.

¹⁵ The only included trial is from Africa. Extrapolation to other areas and populations not possible.

B. Improvement in Water Supply and Quality Compared to No Intervention for Children**Patient or population:** Children; **Settings:** Low- and Middle-income Countries**Intervention:** Improvement in Water Supply and Quality; **Comparison:** No Intervention

Outcomes	Illustrative comparative risks* (95% CI)		Relative effect (95% CI)	No of Participants (studies)	Quality of the evidence (GRADE)	Comments
	Assumed risk	Corresponding risk				
	No Intervention	Improvement in Water Supply and Quality				
WAZ		The mean waz in the intervention groups was 0.03 higher (0 to 0.06 higher)		121 (1 study)	⊕⊕⊕⊖ low ^{1,2}	
Cough	Study population		RR 0.97 (0.84 to 1.12)	5518 (1 study)	⊕⊕⊕⊖ low ^{2,3}

	Moderate			⊕⊕⊕⊕ ⁹
	12 per 1000	6 per 1000 (1 to 65)		very low ⁹

*The basis for the **assumed risk** (e.g. the median control group risk across studies) is provided in footnotes. The **corresponding risk** (and its 95% confidence interval) is based on the assumed risk in the comparison group and the **relative effect** of the intervention (and its 95% CI).

CI: Confidence interval; **RR:** Risk ratio;

GRADE Working Group grades of evidence

High quality: Further research is very unlikely to change our confidence in the estimate of effect.

Moderate quality: Further research is likely to have an important impact on our confidence in the estimate of effect and may change the estimate.

Low quality: Further research is very likely to have an important impact on our confidence in the estimate of effect and is likely to change the estimate.

Very low quality: We are very uncertain about the estimate.

¹ The one included trial was at high risk of bias for attrition, blinding, and loss of clusters and unclear risk of bias for allocation concealment and baseline balance between clusters

² There is only one included study with small sample size from Africa. Extrapolation to other areas and populations not possible

³ The one included trial had high risk of bias for attrition

⁴ The one included trial had high risk of bias for allocation concealment, blinding, and baseline imbalance between clusters

⁵ The one included trial is from a state in India, Asia. Extrapolation to other areas and populations not possible

⁶ Three trials were at high risk of bias while one had unclear risk of bias for allocation concealment. All included trials had high risk of bias for blinding. Three trials were at high risk of bias for attrition. Three trials were at high risk of bias for loss of clusters. Two had unclear risk of bias for baseline imbalance between clusters.

⁷ Studies inadequately powered to study mortality. Total number of events (deaths) very low, below the threshold rule of thumb value of 300.

⁸ Of the 4 included trials 2 were at high risk for allocation concealment, all for blinding, 2 for attrition and 2 for loss of clusters.

⁹ The one included trial had high risk of bias for allocation concealment, blinding, attrition, loss of clusters and unclear risk of bias for random sequence generation, recruitment of clusters and baseline imbalance between clusters

C. Improvement in Sanitation Compared to No intervention for Children**Patient or population:** Children; **Settings:** Low- and Middle-income Countries**Intervention:** Improvement in Sanitation; **Comparison:** No intervention

Outcomes	Illustrative comparative risks* (95% CI)		Relative effect (95% CI)	No of Participants (studies)	Quality of the evidence (GRADE)	Comments

*The basis for the **assumed risk** (e.g. the median control group risk across studies) is provided in footnotes. The **corresponding risk** (and its 95% confidence interval) is based on the assumed risk in the comparison group and the **relative effect** of the intervention (and its 95% CI).

CI: Confidence interval; RR: Risk ratio;

GRADE Working Group grades of evidence

High quality: Further research is very unlikely to change our confidence in the estimate of effect.

Moderate quality: Further research is likely to have an important impact on our confidence in the estimate of effect and may change the estimate.

Low quality: Further research is very likely to have an important impact on our confidence in the estimate of effect and is likely to change the estimate.

Very low quality: We are very uncertain about the estimate.

¹ The one included trial was at high risk of bias for allocation concealment and blinding

² There is only one included trial from Asia. Extrapolation to other areas and populations not possible

³ One trial was at high risk of bias for attrition and one for allocation concealment and blinding

⁴ The one included trial was at high risk for random sequence generation, allocation concealment, blinding, recruitment bias and unclear risk of bias for unit of analysis error

⁵ There is only one included trial from Africa. Extrapolation to other populations and areas not possible.

⁶ Total number of events is less than 300 (a threshold rule-of-thumb value)

⁷ One trial was at high risk of bias for allocation concealment and blinding and one for attrition.

⁸ There are widely differing estimates of the treatment effect (i.e. heterogeneity or variability in results) across studies without a plausible explanation except study design

⁹ The included trial was at high risk of bias for allocation concealment, baseline imbalance of clusters and unit of analysis error.

¹⁰ One trial was at high risk of bias for allocation concealment, blinding and attrition

¹¹ Both trials from Africa. Extrapolation to other areas and populations not possible.

¹² One trial was at high risk of bias for allocation concealment, blinding and baseline imbalance of clusters

D. Improvement in Sanitation and Hygiene Compared to No Intervention for Children

Patient or population: Children; **Settings:** Low- and Middle-income Countries
Intervention: Improvement in Sanitation and Hygiene; **Comparison:** No Intervention

GRADE Working Group grades of evidence

High quality: Further research is very unlikely to change our confidence in the estimate of effect.

Moderate quality: Further research is likely to have an important impact on our confidence in the estimate of effect and may change the estimate.

Low quality: Further research is very likely to have an important impact on our confidence in the estimate of effect and is likely to change the estimate.

Very low quality: We are very uncertain about the estimate.

¹ One trial was at high risk of bias for unit of analysis error and both for blinding and allocation concealment

² Both trials were conducted in rural areas in South Asia. Extrapolation to other areas and populations not possible.

³ Only one trial included from rural Bangladesh. Extrapolation to other areas and populations not possible.

⁴ One trial was at high risk of bias unit of analysis error, one for loss of clusters, two for attrition, two for allocation concealment and three for blinding.

⁵ One trial was at high risk of bias for randomization and recruitment bias, one for unit of analysis error, one for attrition, three for allocation concealment and blinding.

⁶ Only one trial from rural India. Extrapolation to other areas and populations not possible.

⁷ Only one trial from urban slums in Pakistan. Extrapolation to other areas and populations not possible.

⁸ Three of the included trials were non randomized trials. One had high risk of bias for attrition, loss of clusters and unit of analysis error. Three were at high risk of bias for allocation concealment and blinding.

⁹ Two of the three included trials were at high risk for random sequence generation, recruitment bias, allocation concealment and blinding.

¹⁰ Only one trial which was nonrandomized with high risk of bias for allocation concealment, blinding, and recruitment bias

¹¹ There is only one included trial from Asia. Extrapolation to other areas and populations not possible

¹² Total number of events is less than 300 (a threshold rule-of-thumb value)

WEB TABLE I CHARACTERISTICS OF INCLUDED STUDIES

<i>Study</i>	<i>Design</i>	<i>Country</i>	<i>Continent</i>	<i>Age group</i>	<i>N</i>			<i>Intervention category</i>	<i>Intervention details</i>	<i>Outcome of interest</i>
					<i>Total</i>	<i>Intervention</i>	<i>Control</i>			
Slayton 2016	Cluster RCT	Kenya	Africa	< 2 y	738			Hygiene	Antimicrobial Hand Towel	Acute respiratory infections, self-reported fever, and skin infections in children
Shafique 2016	Cluster RCT	Bangladesh	Asia	0-12 mo	467	236	231	Hygiene	Hand Sanitiser	Stunting, Infections
Pickering 2015	Cluster RCT	Mali	Africa	< 5 y	6012	3140	2872	Sanitation	Community-led total sanitation (CLTS) uses participatory methods to eliminate the practise of open defecation in rural communities and promote building of toilets.	Respiratory tract infections, Anthropometry, Mortality
Patil 2014	Cluster RCT	India	Asia	< 5 y	5209	2600	2609	Sanitation	Subsidies for and promotion of individual household latrines that can safely confine feces (similar to Joint Monitoring Programme defined improved sanitation facilities), school sanitation and hygiene education, Anganwadi (preschool) toilets, and community sanitation complexes.	Respiratory tract infections, Anthropometry, Worm infestations
Mahmud 2015	Cluster RCT	Ethiopia	Africa	6-15 y	367	185	182	Hygiene	Handwashing, Nail clipping	Worm infestations
Ercumen 2015	Cluster RCT	Bangladesh	Asia	6 mo-5 y	1814	1209	605	Water	Safe storage and/or water treatment	Mortality
Christensen	Cluster	Kenya	Africa	4-16 mo	432	198	234	Water,	Water treatment, sanitation	Respiratory Tract

2015	RCT							Sanitation and Hygiene	improvement, health education	Infections, Fever. Growth studied (data not provided)
Belizario 2015	CBA study	Philipines	Asia	2-15 y	341	150	191	Sanitation	Community-led total sanitation (CLTS) uses participatory methods to eliminate the practise of open defecation in rural communities and promote building of toilets.	Worm infestations, Anthropometry
Nicholson 2014	Cluster RCT	India	Asia	< 5 y	1680	847	833	Hygiene	Handwashing promotion and provision of free soap	Respiratory infections, School absence
Morris 2014	Cluster RCT	Kenya	Africa	4-10 mo	240			Water	Ceramic water filters (CWFs) remove or inactivate waterborne diarrheal pathogens in drinking water through size exclusion and silver exposure.	Respiratory infections, Febrile illness
Clasen 2014	Cluster RCT	India	Asia	0-5 y	3835	1919	1916	Sanitation	Latrine promotion and construction by combining social mobilisation with a post-hoc subsidy.	Helminth infection, Weight, Height, Mortality
Caruso 2014	Cluster RCT	Kenya	Africa	School children	17564	12262	5302	1. Sanitation and Handwashing vs Control; Handwashing vs Control; Sanitation and Handwashing vs Handwashing	Sanitation: Schools received reusable hardware (buckets, brooms, hand brushes, plastic scoop), consumables (bleach, powdered soap), toilet tissue, handwashing materials, sheets for pupils to monitor latrines conditions daily and training for two	School absence

									teachers – the head teacher and health patron. Handwashing: Received powdered soap and instructions on how to make soapy water	
Pickering 2013	Cluster RCT	Nairobi	Africa	School children	1364	895	469	Hygiene	Provision of soap and water or hand sanitizers for hand hygiene	Vomiting, cough, difficulty breathing, skin rash, rhinorrhea, school absence
Hammer 2013	Cluster RCT	India	Asia	Under 5 years				Sanitation	Latrine promotion and construction by combining social mobilisation with a subsidy.	Height
Gyorkos 2013	Cluster RCT	Peru	South America	10 y	1089	518	571	Hygiene	Hygiene Education	Soil transmitted helminthiasis prevalence
Freeman 2013a	Cluster RCT	Kenya	Africa	School children	915	470	445	Water, Sanitation and Hygiene; Water and Hygiene	Hygiene promotion, water treatment technology, and sanitation infrastructure, which included commercially manufactured hand washing and drinking water storage containers and a 1-year supply of point-of-use water treatment product distributed by Population Services International with the brand name WaterGuard.	Soil transmitted helminthiasis prevalence
Dumba 2013	Cluster RCT	Uganda	Africa	Under 5 years	727	357	370	Sanitation and Hygiene	PHAST means Participatory Hygiene and Sanitation Transformation; a participatory approach	Soil transmitted helminthiasis prevalence

									that uses visual tools to stimulate the participation of people in promotion of improved hygiene and sanitation.	
Boisson 2013	Cluster RCT	India	Asia	All children	2986	1504	1482	Water	Intensive promotion campaign and free distribution of sodium dichloroisocyanurate (NaDCC) tablets	Weight-for-age Z score; school absenteeism
Peletz 2012	Cluster RCT	Zambia	Africa	<2 y	121	61	60	Water	LifeStraw Family filter and two 5-L safe storage containers.	Weight-for-age Z score, Mortality
Huda 2012	CBA study	Bangladesh	Asia	< 5 y	1000	500	500	Water, Sanitation and Hygiene	Improvements in latrine coverage and usage; access to and use of arsenic-free water; and improved hygiene practices, especially handwashing with soap.	Acute respiratory infections
Correa 2012	Cluster RCT	Colombia	South America	1-5 y	1682	749	933	Hygiene	Alcohol based hand sanitiser	Acute respiratory infections
Bowen 2012	Cluster RCT	Pakistan	Asia	< 8 y	461	301	160	1. Hygiene; 2. Water and Hygiene	10 clusters received sodium hypochlorite solution for drinking water treatment; 9 received a flocculent-disinfectant product for drinking water treatment; 10 received soap, handwashing promotion, and flocculent disinfectant for drinking water treatment; 9 received soap and handwashing promotion; and 9 served as the control group.	Weight for age Z score, Height for age Z score, Body Mass Index Z score on long term follow- up

Fenn 2012	CBA study	Ethiopia	Africa	6 mo-3 y	1899	863	1036	Water, sanitation and hygiene	Hygiene education, pit latrines, treated water	Height for age Z score, Stunting
Talaat 2011	Cluster RCT	Egypt	Africa	Median 8 y	44451	20882	23569	Hygiene	Provision of soap and water and education	Acute respiratory infection, Influenza, Conjunctivitis, School absenteeism
Stoller 2011	Cluster RCT	Ethiopia	Africa	0-9 y	1211	608	603	Sanitation	Latrine construction	Ocular chlamydia infection; Trachoma
du Preez 2011	Cluster RCT	Kenya	Africa	6 mo - 5 y	1089	555	534	Water	Solar disinfection of water	Mortality, weight for age, height for age, weight for height
Langford 2011	Cluster non-RCT	Nepal	Asia	3-12 mo	88	45	43	Hygiene	Handwashing promotion	Weight for age Z score, Height for age Z score, Weight for height Z score, cough, cold, fever
Bosisson 2010	Cluster RCT	Congo	Africa	0-15 y	190	85	105	Water	Lifestraw Family filter for water treatment	Fever, Cough
Abdou 2010	Cluster RCT	Niger	Africa	< 5 y	557	284	273	Water	Wells and Handpump	Ocular chlamydia infection; Trachoma
Gungoren 2007	Cluster non-RCT	Uzbeki-stan	Asia	2-14 y	178	95	83	Water, Sanitation and Hygiene	Hand washing with soap, safe disposal of feces and boiling of drinking water.	Soil transmitted helminthiasis prevalence
Bowen 2007	Cluster RCT	China	Asia	School children	3810	2545	1265	Hygiene	Handwashing promotion, soap provision	School absence, Fever, Headache, Otagia, Rhinorrhea, Conjunctivitis, Sore throat, Cough, Vomiting
Rosen 2006	Cluster RCT	Israel	Asia	Pre - school children	1029	489	540	Hygiene	Handwashign promotion, eliminating shared cups and towels	School absence
Luby 2005	Cluster RCT	Pakistan	Asia	< 15 y	4691	3163	1528	Hygiene	Handwashing promotion, soap provision	Acute respiratory infection, Pneumonia, Impetigo, Mortality

Crump 2005	Cluster RCT	Kenya	Africa	< 5 y	715	467	248	Water	Floculent disinfectant and sodium hypochlorite	Mortality
Emerson 2004	Cluster RCT	Gambia	Africa	<9 y	179	83	96	Sanitation	Latrine construction	Trachoma
Quick 1999	Cluster RCT	Bolivia	South America	< 14 y	403	199	204	Water	Point of use water chlorination and safe storage	Soil transmitted helminthiasis prevalence
Conroy 1999	Cluster non-RCT	Kenya	Africa	< 6 y	349	175	174	Water	Solar disinfection of water	Mortality
West 1995	Cluster RCT	Tanzania	Africa	1-7 y	1417	680	737	Hygiene	Facewashing	Trachoma
Ahmed 1994	Cluster non-RCT	Pakistan	Asia	0-18 mo	168	78	90	Hygiene	Hygiene education focusing on ground sanitation, personal hygiene and food hygiene	Weight for age Z score
Stanton 1988	Cluster RCT	Bangladesh	Asia	< 6 y	1390	636	754	Hygiene	Education regarding handwashing, defecation away from house and suitable disposal of waste and faeces	Weight, Height, Weight for age Z score, Height for age Z score, Weight for Height Z score
Schlesinger 1983	CBA study	Chile	South America	0-4 y	197	113	84	Water and Sanitation	Construction of a sanitary unit consisting of a kitchen, sink and lavatory with water supply	Low weight for age

CBA: Controlled before-after; RCT: Randomized controlled trial
